

MARK MODELS INDEX

----- INITIAL THINGS TO REMEMBER :-

- 1) Mark 6 and Mark 7 are untested and unprepared Ideas and are thought in efforts to give future updates to this project.
 - 2) This document has last been updated on 07/02/2025 Monday.
- -----

TESTED MARK MODELS INDEX :-

- 1) Mark 1 :- Code Description :- A Telegram Bot which achieves Image Generation using a pre-trained Stable Diffusion model.

Additional Features :- Google Speech-to-Text.

APIs Used :- None

- 2) Mark 2 :- Code Description :- A Telegram Bot which achieves Image Generation using Image Generation APIs.

Additional Features :- Redis, Automatic Image Sending Mechanism and Simultaneous Image Processing

APIs Used :- Replicate API and OpenAI API

- 3) Mark 3 :- Code Description :- A Telegram Bot which achieves Image Generation using Image Generation APIs.

Additional Features :- Watermarking, Rate Limiting, Banned Words Detection & Auto-Ban, Queue System, Redis Integration, Error Handling and Sends Generated Images to a Group

APIs Used :- Replicate API and OpenAI API

- 4) Mark 4 :- Code Description :- A Telegram Bot which achieves Image Generation using Image Generation APIs.

Additional Features :- Watermarking, Rate Limiting (with customizable Usage Tiers), Banned Words Detection & Auto-Ban (with customizable Usage Tiers), Extended Language Support, Local File Storage, Custom Image Group Forwarding, Redis Integration, Custom Error Handling (Redis Connection Failure, File Saving Failure, Group Message Sending Failure, Translation Failure, Image Generation Timeout, Feedback Email Failure, General API Failures), Queue Management and User Feedback and Excel Metrics Logging.

APIs Used :- Replicate API and OpenAI API and Google Imagen3 API

- 5) Mark 5 :- Code Description :-

- 1) A Telegram Bot which achieves Image Generation using Image Generation APIs.

- 2) A Windows Application Image Editing using Image Generation APIs and Image Editing APIs.

Additional Features :-

1) Telegram Bot :-

Watermarking, Rate Limiting (with customizable Usage Tiers), Banned Words Detection & Auto-Ban (with customizable Usage Tiers), Extended Language Support, Local File Storage, Custom Image Group Forwarding, Redis Integration, Custom Error Handling (Redis Connection Failure, File Saving Failure, Group Message Sending Failure, Translation Failure, Image Generation Timeout, Feedback Email Failure, General API Failures), Queue Management and User Feedback and Excel Metrics Logging.

2) Windows Application :-

Watermarking, Banned Words Detection, Extended Language Support, Local File Storage, Queue Management and User Feedback and Excel Metrics Logging.

APIs Used :-

1) Telegram Bot :- Replicate API and OpenAI API and Google Imagen3 API

2) Windows Application :- Replicate API

Mark 3 was published as InstaVision v1.0.0 on GitHub.

Mark 4 was published as InstaVision v2.0.0 on GitHub.

Mark 5 is the last successfully tested model and it was published as InstaVision v3.0.0 on GitHub.

Mark 5 is the code that has maximum features implemented until now and has been used for hosting this bot on Render platform on Internet.

Mark 5 also marked the end of this project and all future models made have remained untested and unprepared till date.

All models prepared after "Mark 5" are just in the idea phase and have not been developed till date.

UNTESTED MARK MODELS INDEX :-

6) Mark 6 :- Idea Description :-

The Mark 6 model should aim in preparation of a WhatsApp Bot which should comprise all the abilities that are currently present in the Telegram Bot.

7) Mark 7 :- Idea Description :-

The Mark 7 model in both the Telegram Bot and WhatsApp Bot should comprise the ability of Image Editing using both Replicate API and Canva API. Similarly Windows Application should comprise of Canva API and a new Window should be added in the Windows Application which can edit images using the Canva API.
